                                                      AMU MACKOLHADELS.

CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE - ADP +
PROTEIN TYROSINE PHOSPHATE.
BUXDME REGULATION: BECOMES ACTIVATED WHEN ITS MAJOR TYROSINE
PHOSPHORYLATION SITE IS NOT PHOSPHORYLATED. IT CAN ALSO BE
ACTIVATED BY POINT MUTATIONS AS WELL AS BY TRUNCATIONS AT THE
C-TERMINAL END OR BY OTHER MUTATIONS.
POLYOMA VIRUS MIDDLE T ANTIGEN FORMS A COMPLEX WITH PP60-C-SRC.
SIMILARITY: CONTAINS I SH2 DOMAIN.
SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC
DOMAIN. BELONGS TO THE SRC SUBFAMILY.
TO HIGH LEVELS, AND WITH A HIGH DEGREE OF KINASE ACTIVITY, IN
CERTAIN FULLY DIFFERENTIATED CELLS SUCH AS NEURONS, PLATELETS

PT New nucleic acid encoding specific modulators for treatment and cancer and neurodegenerative disease

Talma 2; Page 154-155; 193pp; English.

Caids encoding PPPO4, SAD, PTPO5, PTP10, ALP and ALK-7 proteins. The present sequence represents human SAD. The above proteins, other than CALK-7, are protein tyrosine phosphatases (PPPS) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, or brevent diseases associated with abnormal signal transduction

C pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, serine/threonine kinase) are used to promote neuronal survival, cancer cating and Alakhamer's, Parkinson's or Huntington's colliseases. Nucleic acid fragments of the polynucleotides encoding the

New Data and Central nervous system disorders

The membraneous glomerulonephritis and central nervous system disorders

Claim 7; Page 145-163; 240pp; English.

Chicsp), deduced from the nucleotide-sequence (see V05996) of a

clone obtained by PCR amplification. Full-length sequences for

thuman placenta (see W43312) and parathyroid (see W43314) are also

claimed. hCSP is considered to be the human homologue of rat

thymann nephritis antigen gp330 on the basis of sequence

similarity. It is proposed that the calcium sensor is a

universal sensor for recognition of variation in extracellular

calcium, and plays a key role in calcium regulation via different

corgan systems. hCSP belongs to the low density lipoprotein

superfamily of glycoproteins. It can be expressed in a claimed

host cell using a vector comprising hCSP cDNA. Also claimed are a

method of using hCSP to treat human membraneous glomerulonephritis,

cut at the use of hCSP to screen for agonists and antagonists of hCSP.

Such (antyagonists are useful in the treatment of conditions
                                                                                                                                            ö
proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the

```
This sequence comprises a human placental calcium sensor protein (hCSP), deduced from the nucleotide sequence (see V0595) of a cone obtained by PCR amplification. Full-length sequences for clone obtained by PCR amplification. Full-length sequences for claimed. hCSP is considered to be the human homologue of rat claimed. hCSP is considered to be the human homologue of rat similarity. It is proposed that the calcium sensor is a universal sensor for recognition of variation in extracellular calcium, and plays a key role in calcium regulation via different corgan systems. hCSP belongs to the low density lipoprotein superfamily of glycoproteins. It can be expressed in a claimed are a nethod of using hCSP to treat human membraneous glomerulonephritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               encoding inhibitor of gp

Isolated human calcium sensor protein - useful develop prods. for diagnosis and treatment of conditions, such as membranous diagnosis and treatment of conditions, such as membranous glomerulonephritis.

Claim 7: Page 143-161; 236pp; English.

500 kDa human calcium sensor proteins (CSP) (R97209-11) were identified as the products of CDNA clones (T28774-76) respectively obtd. from human placental, kidney and parathyroid cDNA libraries.

The CSPs show homology to LDL receptor proteins. CSP can be isolated from parathyroid, placental or kidney tubule cells or obtd. by expression of the encoding sequences in transformed host cells. It is useful for identifying potential (ant)agonists and in the diagnosis and treatment of e.g. membranous glomerulonephritis, and also in the treatment of wounds and ulcers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Glaim 7: Page 78-96: 236pp: English.

Claim 7: Page 78-96: 236pp: English.

A 500 kba human calcium sensor protein (CSP) (R97208) was identified as the product of cDNA clone (T28773) obtd. from human kidney and placental cDNA libraries. Full-length sequences of placental, kidney and parathyroid CSP (see also R97209-11) were also obtd. They show homology to LDL receptor proteins. CSP can be isolated from parathyroid, placental or kidney tubule cells or obtd. by expression of encoding sequences in transformed host cells. It is useful for identifying potential (ant)agonists and in the diagnosis and treatment of e.g. membranous glomerulonephritis, and also in the treatment of wounds and ulcers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated human calcium sensor protein - useful develop prods. for diagnosis and treatment of conditions, such as membranous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       31-JUL-1996 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human calcium sensor protein and vector encoding inhibitor of grown was defined transport of amyloid beta protein - useful to treat membraneous glomentulonephritis and central nervous system disorders of claim 7: Page 80-98; 240pp; Equalish.

This sequence comprises a human calcium sensor protein (hCSP), deduced from the nucleotide sequence (see V0594) of clones of the nucleotide sequence (see V0594) of clones of sequences (see W43312-14) for human kidney, placenta and parathyroid are also claimed. hCSP is considered to be the human parathyroid are also claimed. hCSP is considered to be the human calcium, and plays a key role in calcium sensor is a universal sensor for recognition of variation in extracellular calcium, and plays a key role in calcium regulation via different calcium, and plays a key role in calcium regulation via different calcium, and plays a key role in calcium regulation via different calcium, and plays a key role in calcium regulation via different calcium, and plays a key role in calcium regulation via different calcium, and plays a vector comprising hCSP bonk. Also claimed are a nethod of using hCSP to screen for agonists and antagonists of hCSP. Such (arthygonists are useful in the treatment of conditions associated with perturbations in parathroid hormone levels, vitamin D3 production, osstrogen levels, osteoclast or osteoblast activity, calcium and calcium ion homeostasis, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Claim 7: Page 175-193: 236pp; English.
500 kDa human calcium sensor proteins (CSP) (R97209-11) were identified as the products of CDNA clones (T2874-76) respectively obtd. from human placental, kidney and parathyroid cDNA libraries. The CSPs show homology to LDL receptor proteins. CSP can be isolated from parathyroid, placental or kidney tubule cells or obtd. by expression of the encoding sequences in transformed host cells. It is useful for identifying potential (ant)agonists and in the diagnosis and treatment of e.g. membranous glomerulonephritis, and also in the treatment of wounds and ulcers.

New human calcium sensor protein and vector encoding inhibitor of gp 330 mediated transport of amyloid beta protein - useful to treat membraneous glomerulonephritis and central nervous system disorders Claim 7; Page 177-195; 240pp; English.

This sequence comprises a human parathyroid calcium sensor protein (hCSP), deduced from the nucleotide sequence (see V05996) of a clone obtained by PCR amplification. Full-length sequences for human placenta (see W43312) and kidney (see W43313) are also claimed. hCSP is considered to be the human homoloque of rat Heymann nephritis antigen gp330 on the basis of sequence similarity. It is proposed that the calcium sensor is a cultivariant seal sensor for recognition of variation in extracellular calcium, and plays a key role in calcium regulation via different cagan systems. hCSP belongs to the low density lipoprotein
                                                                                                                                                                                                            Claim 7: Page 110-128; 236pp; English.
500 kDa human calcium sensor proteins (CSP) (R97209-11) were
identified as the products of CDNA clones (T28774-76) respectively
obtd. from human placental, kidney and parathyroid cDNA libraries.
The CSPs show homology to LDL receptor proteins. CSP can be isolated
from parathyroid, placental or kidney tubule cells or obtd. by
expression of the encoding sequences in transformed host cells. It is
useful for identifying potential (ant)agonists and in the diagnosis and
treatment of e.g. membranous glomerulonephritis, and also in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Secreted protein encoded by gene 191 clone HJAB265.
Secreted protein, fusion protein; gene therapy; protein therapy; diagnosis; tissue; cancer; tumour; neurodegenerative disorder; leukaemia; developmental abnormality; foctal deficiency; blood; allergy; renal; immune system; asthma; lymphocytic disease; brain; hepatic; lymphoma; inflammation; isofaemic shock; Alzheimer's disease; restenosis; AIDS; cognitive disorder: schizophrenia; prostate; obesity; osteoclast; thymus; osteoporosis; arthritis; testis; lung; thyroiditis; thyroid; digestion; endocrine; metabolism; regulation; malabsorption; gastritis; neoplasm.
                                                                                                                                                                                     ö
                                                                                                                                                                                     Gaps
superfamily of glycoproteins. It can be expressed in a claimed host cell using a vector comprising hCSP DNA. Also claimed are a method of using hCSP to treat human membraneous glomerulonephitis, and the use of hCSP to screen for agonists and antagonists of hCSP. Such (antiagonists are useful in the treatment of conditions associated with perturbations in parathroid hormone levels, vitamin D3 production, oestrogen levels, osteoclast or osteoblast activity, calcium secretion and calcium ion homeostasis, e.g. Sequence 4655 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   되었다
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see V59511 for described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Processor of the alpha-2 members of the minorinal Receptor Receptor group are claimed. The alpha-2 mederating and preferred parent receptor Treating and preventing from the are captor for the alpha-2 mederating and prevent receptor. The alpha-2 mederating and members of the minorinal Receptor group are claimed. The alpha-2 macroglobulin/Lbr-receptor receptor for members of the Minorinal Receptor group are claimed. The alpha-2 macroglobulin/Lbr-receptor receptor for members of the minorinal Receptor group are claimed. The alpha-2 macroglobulin/Lbr-receptor related parent receptor. The derive, which are preferred parent receptor. The derive, which are preferred parent receptor. The derive, which are preferrably is a preferred parent forms of the native receptors, are useful for treating and preventing virial (esp. rininoviral) infections.

N.B. the SEQ.ID. listing includes a sequence (no.4) which differs from the alpha-2 mR/LRP sequence as indicated in the Features Table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        family;
                                                                                                                                                                                                                                                                                                                                                                                                                                  Alpha 2-Macroglobulin/LDL-receptor related protein.
alpha-2 macroglobulin, Low Density Lipoprotein, LDL; receptor family, LDL receptor related protein, LRP; small rhinovirus receptor; deriv, minor Rhinovirus; alpha2MR/LNP.

systemic lupus erythematosus measures parameter parameters and as systemic lupus erythematosus.

Disclosure; Page 27; 118pp; English.

The present sequence is an antiphospholipid (apt) analogue clone 2G12 screened from ACA-6501 phage library. Peptides are derived from screening random peptide phage libraries to identify the sequences which best minic the epitopes recognised by apt antibodies. A method has been produced for identifying analogues of key epitopes recognised by apt antibodies in patients suffering from PAPS, APS and other apt antibody-mediated diseases. The products and methods can be used for the diagnosis and treatment of apt antibody-mediated pathologies such as systemic lupus erythematosus, antibody-mediated pathologies such as systemic lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               19-50-1996.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

An immunoglobulin heterotetramer subunit consists of two identical light (kappa or lambda) and two identical heavy (alpha, delta, epsilon, gamma, or mu) chains usually stabilized by interchain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into larger oligomers g.

1 HAIHRCHP 8 Description: Perfect Score: Sequence: PAM 150 Gap 11 Scoring table:

77977 segs, 28268293 residues

Searched:

Post-processing: Minimum Match 0% Listing first 45 summaries

swiss-prot37 1:swissprot Database:

Mean 21.282; Variance 25.495; scale 0.835 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The nucleotide sequence coding for virion structural proteins.";

TICK-borne encephalitis virus genome. The nucleotide sequence coding for virion structural proteins.";

LL FEBS LETT. 200:317-321(1986).

C. !- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HUDOPHOBIC. SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

C. !- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROFIEN BAND GLYCOPROFIEN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN M AND GLYCOPROFIEN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

C. !- THE NOWSTRUCTURAL PROTEINS NSI PRESENTS TWO ALTERNATIVE CLEAVAGE SITES FOR ITS C-TERMINUS, WHICH MAY DEFINE A SOLUBLE OR A MEMBRANE-BOUND FORM OF NSI.
GENOME POLYPROTEIN [CONTAINS: CAPSID PROTEIN C (CORE PROTEIN); MATRIX PROTEIN (ENVELOPE PROTEIN M); MAJOR ENVELOPE PROTEIN E; NONSTRICTURAL PROTEINS NS1, NS2A, NS2B, NS2B, NS4A AND NS4B; HELICASE (NS3); RNA-DIRECTED RNA POLYMERASE (EC 2.77.48) (NSS)].
TICK BORNE ENCEPHALITIS VIRUS (STRAIN SOFJIN) (TBEV).

                                                                                                                                                                                                    NATURE 375:291-298(1995).

-1- FUNCTION: THE SMALL PROTEINS NS2B, NS2B, NS4B AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-1- SUBUNT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C. AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RNA-DIRECTED RNA POLYMERASE (NS5)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ENVELOPE GLYCOPROTEIN M.

J. VIROL. 65:4070-4077(1991).

-! FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

-! SUBDUILT: THE VIRIAN OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE CONSISTS OF TWO PROTEINS.

-! THE VIRIAN OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

-! THE NONSTRUCTURAL PROTEINS NSI PRESENTS TWO ALTERNATIVE CLEAVAGE SITES FOR ITS C-TERMINGS, WHICH MAY DEFINE A SOLUBLE OR A MEMBRANE-BOUND FORM OF NSI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                POLYPROTEIN; GLYCOPROTEIN; TRANSFERASE; RNA-DIRECTED RNA POLYMERASE; CORE PROTEIN; HELICASE; ATP-BINDING; CORT PROTEIN; PROTEIN; HELICASE; ATP-BINDING; TRANSMEMBRANE; NONSTRUCTURAL PROTEIN.

GENOME POLYPROTEIN (CONTAINS CAPSID PROTEIN C (CORE PROTEIN); MATRIX PROTEIN (ENVELOPE PROTEIN M); MAJOR ENVELOPE PROTEIN E; NONSTRUCTURAL PROTEINS NS1, NS2A, NS2B, NS4A AND NS4B; HELICASE (NS3); RNA-DIRECTED TICK-BORNE POWASSAN VIRUS (STRAIN LB).

VIRUSES; SSRNA POSITIVE-STRAND VIRUSES, NO DNA STAGE; FLAVIVIRIDAE;
                                                                                                                                                                                                                                                     MANDL C.W., HOLZMANN H., KUNZ C., HEINZ F.X.;

"Complete genomic sequence of Powassan virus: evaluation of genetic elements in tick-borne versus mosquito-borne flaviviruses.";

VIROLOGY 194:173-184 (1993).

-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEBCAPSID COVERED BY A LIPPOPROTEIN ENVELOPE. CONSISTS OF TWO PROTEINS.

-!- FUNCTION AND GLYCOPROTEIN E. THE NUCLEBCAPSID IS A COMPLEX OF PROTEIN CAND AND MAND.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RNA-DIRECTED RNA POLYMERASE (NSS).

C. -! FUNCTION: BINDS SPECIFICALLY CLUSTERIN WITH HIGH AFFINITY, BUT ALSO LIGANDS IN COMMON WITH OTHER FAMILY MEMBERS: PLASMINOGEN,

EXTRACELLULAR MATRIX COMPONINTS, PLASMINOGEN ACTIVATOR PLASMINOGEN,

EXTRACELLULAR MATRIX COMPONINTS, PLASMINOGEN ACTIVATOR INHIBITOR TYPE I COMPLEX, APOLIPOPROTEIN E-ENRICHED

C. - FUNCTION: RECEPTOR-MEDIATED UPTAKE OF POLIBASIC DRUGS SUCH AS

APROTININ, AMINOGLYCOSIDES AND POLIFMXXIN B (BY SIMILARITY).

C. - FUNCTION: MAY PARTICIPATE IN REGULATION OF PARATHYROID-HORMONE AND

PRARA-THYROLD-HORMONE-EREATED PROTEIN RELEASE.

C. - SUBUNIT: FORMS A MULTIMERIC COMPLEX TOGETHER WITH A RECEPTOR-

ASSOCIATED PROTEIN (RAP).

C. - SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN MITH A RECEPTOR-

SOCIAL SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN WITH A RECEPTOR-

ASSOCIATED PROTEIN (RAP).

The Ascolar conveces cerevisiae Was6 gene encodes the 36-kDa subunit of the vacuolar H(+)-ATPRASE IS RESPONSIBLE FOR ACIDIFYING A VARIETY OF INTRACELLULAR COMPATIBLE IS RESPONSIBLE FOR ACIDIFYING A VARIETY OF INTRACELLULAR COMPATIBLES IN BUNARYOTIC CELLS. THE ACTIVE ENZYME CONSISTS OF A CATALYTIC VI DOMAIN ATTACHED TO AN INTEGRAL MEMBRANE COMPONENT OF THE MEMBRANE PORE DOMAIN AND IS REQUIRED FOR PROPER ASSEMBLY OF THE WEMBRANE PORE DOMAIN AND IS REQUIRED FOR PROPER ASSEMBLY OF VI SUBUNITS ONTO THE MEMBRANE SECTOR OR ALTERNATIVELY MAY PREVENT THE PASSAGE OF PROTONS THROUGH VO PORES.

C. I. SUBUNIT: COMPOSED OF AT LEAST 10 SUBUNITS.

C. I. SUBUNIT: COMPOSED OF AT LEAST 10 SUBUNITS.

C. I. SIMILARITY: BELONGS TO A FAMILY THAT GROUPS V-ATPASE SUBUNIT C.

CELL REPRODUCTION. PP.12:379-389, ACADEMIC PRESS, NEW YORK (1978).

-!- FUNCTION: SPECIES-SPECIFIC SEA URCHIN SPERM PROTEIN REQUIRED FOR ADHESION OF SPERM TO THE EGG SURFACE DURING FERTILIZATION. BINDIN COATS THE ACROSOMAL PROCESS AFTER IT IS EXTERNALIZED BY THE PLOYSACCHARIDES ON THE VITELIANE LAYER RECEPTOR PROTEGLYCANS.

WHICH COVER THE EGG PLASARA MEMBRANE.

-!- SUBCELLULAR LOCATION: MAJOR PROTEIN COMPONENT OF THE LUMEN OF THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Mean 20.687; Variance 24.857; scale 0.832

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 9.259; Variance 3.020; scale 3.066 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
